.U4
no. 8870

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in island territories under U.S. administration.

This publication has been cataloged as follows:

ANALYSES OF NATURAL GASES, 1917-80

By B. J. Moore[1]

ABSTRACT

This publication contains 12,554 analyses of gas samples from oil and gas wells and natural gas pipelines in 39 States and 24 foreign countries. These gas samples were collected in the period 1917-80 as part of the Bureau of Mines survey for helium occurrences. The gas analyses contained herein were made by several methods over the period covered. Analytical work on samples collected early in the period was done on the Orsat apparatus. The one-cut apparatus and four-cut fractional distillation equipment were added later. In 1949, a mass spectrometer was acquired and used for all gas analyses made after that time. Helium analyses throughout the period covered were made on special helium analytical equipment designed and built by the Bureau of Mines' Helium Operations Laboratory.

INTRODUCTION

Since 1917, gas samples from oil and gas wells and natural gas pipelines throughout the United States and other countries with free market economies have been collected by the Bureau of Mines in a continuing search for helium occurrences. Analyses of 12,554 of the samples, which were collected in 39 States and 24 foreign countries, are given in tables 1-4.

The Bureau is charged with the responsibility for insuring a continuing supply of helium to meet essential Government needs, and this survey of the world's natural gasfields is made in connection with this responsibility.

A previous publication[2] presented the analyses made through 1974.

That book contained 10,562 analyses, and this publication is an update of that compilation.

Most of these analyses have also been published in other Bureau publications. The first of this series of publications, Bulletin 486,[3] was published in 1951. This was followed by two more bulletins, 576[4] and 617,[5] published in 1958 and 1963, respectively. These three publications contained data on analyses of 5,218 gas samples collected from the beginning of the survey through 1960. Beginning in 1961, data on gas analyses have been published on an annual basis, and 19 Information Circulars[6] have presented the analyses of 6,934 gas samples collected through 1979.

The present compilation of gas analysis data was prepared to make available from one source information on composition of natural gases throughout the United States and in many other areas of the world. A magnetic tape, which contains duplicate data of that presented in tables 1-4, is also available.[7]

HISTORICAL BACKGROUND

The survey to locate helium occurrences throughout the United States has been carried on since the inception of the Government's helium program in 1917. A major goal of this program has been to conserve helium that would otherwise be wasted. Through 1980, over 16,000 gas samples have been collected and analyzed as a part of this survey. In addition to collecting samples from domestic gasfields, the search was expanded in 1965 to include foreign gasfields. Although several foreign samples had been analyzed prior to 1965, no active solicitation of samples had been made.

The results of some of the analyses made in connection with this program are not included in this compilation. Some reasons for exclusion of analyses are air contamination above permissible levels, incomplete analyses, and maintaining the confidentiality of data that were not released by the company supplying the gas sample. This confidentiality is promised to each company when contacted for a gas sample; however, most data are subsequently released for publication or public presentation by the supplier.

World War I caused a flurry of activity and interest in helium production. As a result of this interest, the Government's first helium extraction plant was constructed in Fort Worth, Tex., by the Department of the Navy, to process gas from the Petrolia Field in Clay County, Tex. Many of the samples collected for the helium survey in this 1917–19 period were analyzed for helium content only.

A second phase of the helium survey was begun in 1919 and continued until 1933. Samples collected during this period were analyzed by the Orsat combustion method and by a special helium apparatus. One result of this phase of the survey was the discovery of helium-rich gas at Cliffside Field in Potter County, Tex. The Government acquired the gas rights in fee in Cliffside Field and subsequently built a second Government-owned helium extraction plant near Amarillo, Tex., to process this gas. This plant was built by the Bureau of Mines in 1928–29, after the supply of gas to the plant at Fort Worth was nearly depleted.

The helium survey was relatively inactive from July 1933 to April 1941, when World War II began to create an increased demand for helium. The survey was intensified during the war and resulted in the location of sites for four new helium plants in Kansas, New Mexico, and Texas, and the plants were built in 1943–44. After World War II, production capacity of the five plants was greater than postwar demand. Because of the excess capacity and a dwindling helium-rich gas supply, the Cunningham, Kans., plant was dismantled. The Otis, Kans., and Shiprock, N. Mex., plants were placed on standby. The Amarillo, Tex., plant operated intermittently from 1945 through 1951, and the Exell, Tex., plant operated continuously.

In 1951, an increasing helium demand made it necessary to put the Otis, Kans., plant back into production. The Shiprock, N. Mex., plant resumed operations in 1953. Both of these plants were operated continously until 1968, except for a shutdown of almost a year at Shiprock because of gas supply problems. In 1968, when Bureau of Mines sales of helium decreased markedly, both plants were shut down permanently. The Otis, Kans., plant was sold and the Shiprock, N. Mex., plant was deeded to the Bureau of Indian Affairs, which turned the plant over to the Navajo Indian Tribe.

In the 1940's and 1950's, a major helium-rich gas source was being developed in the Oklahoma Panhandle. The Keyes Field was discovered in 1943 and gas samples from wells in the field contained an average of about 2 percent helium. In 1958, the Bureau obtained the exclusive helium processing rights to most of the gas for the life of the field. An extraction plant was built near Keyes, Okla., to process Keyes Field gas. The plant has operated continuously since completion in 1959 but is expected to cease helium extraction operations during 1981 because of declining gas supplies and excessive cost of operations. The Amarillo plant ceased gas processing operations in April 1970. In September 1971, the Exell plant stopped processing West Panhandle Field gas, its source of supply since it began operation. Equipment has been installed at the Exell plant to process and purify the helium that was purchased by the Government and is in storage in Cliffside Field.

In the early 1960's, demand for helium for Government programs continued the growth that started in 1950, while the helium-rich gas resources declined. Because of this decline, Congress passed legislation in 1960 authorizing a helium conservation program. The objective of this program was to save for future use about 52 billion cubic feet of helium that would have otherwise been lost as the gas was used for fuel. To implement this program, four long-term contracts were negotiated with private firms for the Government's purchase of helium; these contracts obligated the Government for up to $47.5 million per year. Five extraction plants were built adjacent to large natural gas transmission lines in Texas and Kansas. Most of the gas processed was produced from the West Panhandle Field of Texas and the Hugoton Field in Texas, Oklahoma, and Kansas. These two fields contained the largest known helium reserves in the world. Previous helium resource evaluation work by the Bureau had established that this area was the most promising source for the recovery of helium. Minor volumes of gas were produced from smaller fields in the same area. The extracted helium was stored in the Government-owned Cliffside Field in Potter County, Tex. When this helium is required to meet demand, it will be withdrawn, purified, and sold.

Through November 1973 when acceptance of helium under these contracts ceased, 34.2 billion cubic feet of helium had been stored. As of January 1, 1981, helium stored in Cliffside Field totaled 40.4 billion cubic feet. This consisted of the 34.2 billion cubic feet of helium purchased, 3.6 billion cubic feet of excess production from Bureau plants, and 2.6 billion cubic feet that was stored for private companies under separate contracts. In addition to the stored helium, the remaining native gas in Cliffside contains about 4.1 billion cubic feet of helium. Helium is measured at a pressure and temperature base of 14.7 psia and 70 °F.

HELIUM RESOURCES EVALUATION

Even though helium resources are more than adequate to supply Government needs at present and for some time in the future, the helium resources evaluation program is continued so that resources can be located that may be required to supply future demands. Experience shows that it takes about 15 years from the time of discovery to the time of explcitation of a helium resource. Of particular interest are reserves of helium found in gases with low heating values. This gas is not as likely as higher heating value gases to be produced for fuel, so the helium is effectively "stored" and will be available for extraction at a later date when the need arises. These resources are classified as "nondepleting helium reserves" and serve as a backup to the helium stored in the Cliffside Field.

Much of these nondepleting helium reserves are located on Federal lands, and under the standard Government oil and gas lease, helium ownership is reserved to the Federal Government. These reserves are, therefore, under Federal control, and although a lessee may produce the gas with which the helium is associated, the Government has an option to extract, or have extracted, the helium contained in the gas.

In 1965, the helium resource evaluation was expanded to include foreign gasfields. Although several samples from foreign fields had been analyzed prior to that time, no active solicitation of gas samples had been carried on. It was believed that with the growing importance and use of helium, it was necessary to acquire reasonably detailed and documented knowledge of the helium resources outside the United States. Samples from 24 foreign countries have been received. Most of these analyses appear in tables 3-4.

The helium resource evaluation program has been carried on in varying degrees of intensity for over 60 years. Gas samples from most natural gasfields in the United States and from a few fields in foreign countries have been analyzed. Most of these analyses are presented in tables 1-4. While many of the fields in the gulf coast area have not been sampled for the survey, all major transmission lines carrying gas from that area have been sampled. The helium resource evaluation has accomplished its purpose in that it has identified the helium reserves and resources from which demand has been fully supplied. The evaluation is a continuing Bureau program with the objective of locating adequate supplies to meet future demands.

METHODS OF ANALYSES

The samples collected in the earlier years of the helium survey program were analyzed by the Orsat apparatus with the helium content being determined by an apparatus developed by H. P. Cady and D. F. McFarland, early researchers on helium occurrences in natural gases, and improved by Bureau of Mines personnel. In using the Orsat method, the hydrocarbons occurring in natural gases were calculated and reported as methane and ethane; thus, the true distribution of the hydrocarbon components is not known if the gas contained hydrocarbons other than methane and ethane. Because of this, the calculated heating value and specific gravity for samples analyzed before April 1949 are not considered as reliable as those calculated from other methods of analysis. Both the helium apparatus and the Orsat apparatus are described in detail in Bulletin 486.[8]

The one-cut apparatus and the four-cut fractional-distillation analytical equipment were used to analyze a few helium survey samples during the period when the Orsat apparatus was in general use. The one-cut apparatus, also described in Bulletin 486,[9] has all of the units normally found on an Orsat apparatus and, in addition, equipment for separating methane from ethane and the heavier hydrocarbons. An exact methane content is available but all other hydrocarbons are reported together. The four-cut fractional-distillation apparatus has been described by Shepard and Porter.[10]

The previously mentioned helium apparatus developed by Cady and McFarland was replaced by a device, again described in Bulletin 486,[11] that depends on pressure measurement at a constant volume rather than volume measurements at a constant pressure as did the first apparatus.

The mass spectrometer replaced the Orsat apparatus in the helium survey analytical work in 1949. With the mass spectrometer, 15 components plus the helium content were reported. Helium content is calculated from data from the mass spectrometer, but it is also determined on the helium apparatus. The helium apparatus is essentially the same as that described in Bulletin 486[12] with a few modifications. Both the mass spectrometer and the modified helium apparatus are described in Bulletin 576,[13] a supplement to Bulletin 486.[14] The present helium apparatus has been changed slightly from the described equipment.

The components in the analyses are reported to the nearest 0.1 percent, except helium, which is reported to the nearest 0.01 percent. The word "trace" is used to denote quantities of helium of less than 0.005 percent and quantities of other components of less than 0.05 percent. The percentage of hydrogen sulfide reported in each sample may not be completely reliable because of the transfer of the sample over water in the laboratory. Most samples submitted are taken by water displacement, and hydrogen sulfide is highly soluble in water.

GEOLOGICAL PROVINCES OF THE UNITED STATES

The tables include geologic province codes so that each sample source can be located within a specific geologic province as defined by the Committee on Statistics of Drilling of the American Association of Petroleum Geologists.[15] This information was added in Information Circular 8749[16] and is included with all analyses in the publication. These provinces, which are shown in figure 1 and the accompanying list are delineated by political boundaries for convenience and for accommodation of data processing equipment. The list and figure 1 are taken from the article cited in footnote 15. Not all of the provinces shown are gas-producing areas, so many of the codes are not used in this publication. In offshore areas, only one code is used for each State since State or Federal ownership is not always known. Only one code, 972, is used for all wells in Alaska, both onshore and offshore, because of the lack of information on the location of wells in that State.

[15]Meyer, R. F. Geologic Provinces Code Map for Computer Use. AAPG Bull., v. 54/7, July 1970, pp. 1301–1305.
[16]Work cited in footnote 6.

COMPOSITION OF NATURAL GASES AND THEIR HELIUM CONTENT

The tables included in this section give the results of analyses and related source data on 12,554 gas samples. Tables 1 and 2 show data on samples from the United States, and tables 3 and 4 show samples from foreign countries. The samples are further broken down as to their sources with tables 1 and 3 from individual gas or oil wells and tables 2 and 4 from pipeline or multiple-well sources. Some miscellaneous sources, such as water wells or gas seeps, are included with the individual well tables.

The following list indicates the sources of the samples listed in the tables:

Source	Number of samples	Tables
UNITED STATES:		
Alabama	31	1,2
Alaska	70	1
Arizona	89	1,2
Arkansas	197	1,2
California	253	1,2
Colorado	497	1,2
Florida	4	1
Georgia	4	1,2
Idaho	21	1
Illinois	18	1
Indiana	30	1,2
Iowa	4	1
Kansas	1,543	1,2
Kentucky	89	1,2
Louisiana	435	1,2
Maryland	9	1

ACKNOWLEDGMENTS

The helium survey program is conducted by soliciting natural gas samples throughout the United States and other countries with free market economies. Without the assistance of the oil and gas industry, State and national agencies, and many individuals engaged in oil and gas exploration and production, the helium survey with its present scope would be impossible.

The analyses listed in the tables were made by the Section of Research and Analytical Services of the Branch of Engineering, Division of Helium Operations, Bureau of Mines, Amarillo, Tex. The list of analyses was produced through use of a computer by the Section of Automatic Data Processing, Branch of Administration, Division of Helium Operations, Bureau of Mines, Amarillo, Tex.
